SUMMARY

Software engineer with 8 years of paid frontend work in Angular and TypeScript. Since September 2026 I have been building Go backend services for my own product: a licence server, shop and payment watcher that run in production on PostgreSQL and Docker. Looking for a backend role with visa sponsorship, or remote work.

GO BACKEND PROJECT

Licensed MetaTrader 5 tool (own product) | Sole developer | 09/2026 – Present

- Built with AI coding agents. I set the requirements, reviewed and tested the work, and run it in production.
- Built a Go licence server for activation, trials, refresh, seat limits and an audit log, on PostgreSQL in production. A row lock (SELECT ... FOR UPDATE) enforces seat limits; a concurrency test fails when the lock is removed.
- Built a payment watcher that reads USDT transfers on TRON, BNB Smart Chain and Ethereum, and matches each to a unique order amount after enough confirmations. It holds no private keys. Unmatched transfers go to an admin page.
- Built a shop in English, Persian and Arabic with right-to-left layouts. My own real test purchase passed end to end; there are no paying customers yet.
- Built an admin panel with a PBKDF2 password and TOTP, listening on loopback only and reached through an SSH tunnel.
- Wrote offline licence verification in pure MQL5 (Ed25519 and SHA-512). It passes the RFC 8032 test vectors and takes 2.7 ms per signature in MetaTrader 5.
- Run it with Docker Compose, Caddy and nightly database backups. When the server disk went read-only in a hosting incident, I pulled backups and later verified a fresh dump by restoring it into a throwaway PostgreSQL.
- Tests: 136 Go test functions across the licence, shop, payment and admin packages, plus a CI target that runs tests, a release build and guard scripts.

GO TRADING RESEARCH (DEMO ACCOUNT ONLY)

Trading assistant and research harness | Sole developer | 09/2026 – Present

- Built a Go assistant that runs signals through risk gates and needs human approval and confirmation before an order reaches MetaTrader on a demo account.
- Built a walk-forward research harness that hands each strategy only past candles, so it cannot look ahead, and reports results after costs with t-statistics.
- Result: no strategy showed an edge. A pre-registered test on about 3,000 trades per symbol failed on both, and optimisation stopped there.

EMPLOYMENT

Tabin Tech | Frontend Engineer | 01/2022 – Present (part-time 03/2023 – 12/2024)

- Build and maintain Angular client applications, including pastil.ir, nam.ir and migline24.com, now on Angular 22 with TypeScript, RxJS and GraphQL.
- Built shared Angular libraries (vft-core, vft-auth, vft-table, vft-ui-util) published to a private Nexus registry.
- Mentored engineers through code review.

Agatizer | Frontend Engineer, remote contract | 08/2021 – 12/2021

- Built a copy-trading dashboard that rendered live WebSocket data with D3.js, using virtual scrolling and RxJS streams.

Tushehbar Shipping Agency | Frontend Engineer, part-time | 11/2020 – 10/2021

- Built an Angular and DevExtreme dashboard that reduced manual data entry in logistics workflows.

Missha | Frontend Engineer, part-time | 10/2020 – 02/2021

- Built a localized Persian e-commerce PWA with offline support through Service Workers.

Azki | Frontend Developer Consultant | 09/2020 – 10/2020

- Improved mobile usability and SEO on a Laravel Blade insurance platform.

eSafar | Frontend Developer, then Frontend Engineer (part-time) | 05/2020 – 08/2020 and 10/2021 – 01/2022

- Built an Angular travel-booking frontend with i18n and PWA support.

Shenoto | Frontend Developer | 09/2018 – 05/2020

- Led the migration to Angular 7 and built a podcast player with wavesurfer.js.

FREELANCE

WordPress sites for small business clients: faracake.com (custom PHP plugins for orders and inventory) and nushamoments.ir (product catalog), 2026.

OPEN SOURCE

angular-lazy-load-directive: npm package for image lazy loading with Angular signals. One merged docs fix in angular/angular (PR #62361).

SKILLS

Backend: Go, PostgreSQL, SQLite, REST APIs, Docker, Caddy, Nginx, Linux server setup.

Frontend: Angular, TypeScript, RxJS, Signals, GraphQL, SSR, PWA, React, Next.js.

Other: MQL5, PHP, WordPress, Git, GitHub Actions, GitLab CI.

EDUCATION

Bachelor's degree, Computer Engineering. Islamic Azad University, South Tehran Branch, 2015 – 2021

LANGUAGES

Persian (native). English (working proficiency; no formal test taken yet).
